### **Memorial Satilla’s behavioral health unit relocates to beautifully renovated space at rehab center**

WAYCROSS, Ga. (June 17, 2022) – Memorial Satilla Health recently relocated its inpatient senior behavioral health unit to a newly-remodeled wing at our rehabilitation center at 2500 Satilla Parkway in Waycross.

The beautiful new facility includes 15 patient beds with private and semi-private rooms, group therapy rooms and activity rooms for both quiet and loud activities. Our psychiatric services include a program for adults 50 and above. Our specialists help patients manage a wide range of behavioral health difficulties with individualized treatments for older adults with acute emotional health stressors or symptoms that cannot be safely and adequately addressed on an outpatient basis.

“The fundamental philosophy of our program is based on the premise that an integrative care by nursing, medical and psychiatric services is the best care model for our patients. Multidisciplinary teamwork allows for close and meaningful collaboration with family and different medical providers,” said Dr. Jaymal Patel. “We emphasize this approach throughout the stay at our senior behavioral unit to provide our patients with the most caring and comprehensive care possible.”

Dr. Patel welcomes potential patients and families to reach out to us with questions. “We would love to spend individual time with you to understand how we can meet your goals,” he added.

Our senior psychiatric care program includes assessment/treatment of mental state due to depression, dementia, anxiety or substance abuse; counseling; group, recreation and music therapies; occupational therapy; psychiatric evaluations; and spacious rooms in a safe, comfortable environment.

Our care plans include physician-guided active psychiatric treatment, aftercare planning to address post-hospitalization needs, family and individual support systems with loved ones as part of the treatment team, medical assessments and management, medication administration/monitoring if needed, and ongoing contact with personal and medical caretakers or aftercare facilities when appropriate.
